

On the Subject of Module Name

Your flavor text should go here.

Here are templates for commonly used manual features. Make sure to always use closing tags (the ones with a / in them).

Bullet Points (Unordered Lists)

- Bullet points should use the and tags.
- You can even have nested bullet points:
 - Indented
 - Bullet Points
- Or numbered lists:
 1. Indented
 2. Bullet Points

Numbered Lists (Ordered Lists)

1. Numbered lists should use the and tags.
2. Nested lists work just like unordered lists (see above).

Text

Use paragraph tags (<p></p>) for text blocks. In addition, for text formatting, use:

- **Bold:** (HTML) or font-weight: bold; (CSS).
 - Bold in table headers should be achieved through the use of the <th></th> tag.
- Underline: (HTML) or text-decoration: underline; (CSS).
- Line Break:
 (HTML)

For the most part, HTML versions of bolding and underlining is recommended. Note that italics are not used in vanilla manuals besides flavor text and references to appendices, and therefore is not included above. Also, here are some sample headings:

Example Big Heading

Example Small Heading

Example Tables

Part of table	How to make
Rows and Columns	Use <code><tr></tr></code> for rows. Use <code><th></th></code> or <code><td></td></code> for columns within rows (see below).
Headings (left column and top row, in most cases)	Use <code><th></th></code> ...
Cells	Use <code><td></td></code>
Merged Cells	Use <code>rowspan="_"</code> for merging cells vertically. Use <code>colspan="_"</code> for merging cells horizontally.
Note that merged cells created in other rows are skipped in affected rows (see HTML for above row).	

If the table contents are not wide enough, tables are centered by default due to the `table` rule of the first `<style>` block (see above code).

Cell 1	Cell 2
Cell 3	Cell 4

Images

Use the `` tag for images. Make sure to put your images into the `/img/[Module Name]/` folder. Adjust the width with CSS, using `width: _%;` (recommended) or `width: _px;`. Example:

Making the PDF

To make a PDF version of your manual, open the HTML file in Google Chrome and open the "Print" dialog (Usually `CTRL+P`) and choose "Save as PDF" as the destination.

Appendix M: Additional Notes

Here other things to keep in mind when making a manual page:

- There are comments `/* ... */` in the CSS code in the `<style>` blocks containing instructions. Follow those instructions before finishing your manual.
- Normal and Needy module manual pages are formatted similarly. Widget manual pages are appendices and are formatted as such.
- Each manual or appendix page should have a `<div class="page-footer...>` at the bottom of the page, updated accordingly.
- Don't be afraid to ask for help if needed!
- A few things to reiterate:
 - Make sure to never forget closing tags (the ones with a `/` in them).
 - For the most part, HTML versions of bolding and underlining is recommended.
 - Italics are not used in vanilla manuals besides flavor text and references to appendices, and therefore is not included above.
